

## POST TREATMENT INSTRUCTIONS

### Lipotropic Injection

Lipotropic nutrients are a class of natural ingredients that play an important role in the body's use of fat. These compounds enhance liver and gallbladder's role by decreasing fat deposits and speeding up the metabolism of fat and its removal. Our formula of Lipotropics has been formulated to enhance your current weight loss efforts i.e. following a healthy diet plan, staying well hydrated, and exercising.

#### **Side effects are rare**

**Upset stomach and urinary problems:** If you are not adequately hydrating, this fat-fighting cocktail can put a strain on the kidneys. This strain can lead to a stomach ache and possibly urinary problems. These side effects are temporary and will subside as you hydrate.

**Exhaustion from Lipotropic injections:** One of the ways that lipotropic injections help you lose weight and fat is by temporarily changing the function of the digestive system. By increasing your metabolism and efficiency of the digestive tract, your body is working at a higher level than usual. This increased workload can lead to extreme exhaustion in the period immediately following the injection.

**Pain or tenderness at the injection spot:** It is possible to experience some pain and tenderness at the point of injection. The pain tends to go away quite quickly. Please contact us if you are experiencing swelling, pain, and redness at the injection spot after a few days, as you may have an infection at the injection site.
